Wayne Turner has been in the underground utility industry for over 45 years. During his 26-year tenure in the precast industry he traveled to Austria to meet with Agru to learn about their HDPE Concrete Protective Liner “Sure Grip”. In 1995 he began marketing the benefits of the Agru HDPE liner to extend the life of at-risk concrete in precast lift stations and turbulent manholes. He was instrumental in the very first Agru lined precast lift station installation in the US in October of 1995.

From there the demand for Agru’s liner in precast sanitary structures extended to cast-in-place wastewater structures and rehab. He left the precast business in 2009 and started his own plastic fabrication and field installation company. In 2010 Agru asked Wayne to teach and train other fabricators and welders across the USA as demand increased. He is an authorized welding trainer for Agru and holds a DVS welding certificate.

Wayne sold his fabrication company in October of 2020 and started Turner Plastics Consulting. He now travels across North America and the Caribbean teaching new installers and welders how to properly install and weld the concrete protective liner system.
